BlackMail

One message. Two voices.

Our app flips one old assumption about messaging: the casual message you fire off should not be the permanent record.

Built with coding agents | Node.js 22 API | Nebius AI | Supabase | WebRTC peer-to-peer | Redis | Vercel

The assumption we flipped

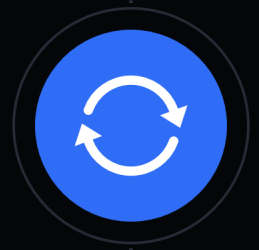

Typical messaging

You type in your real, casual voice
"bro these numbers are wrong, redo the totals"

You hit send: one version, no filter
What you felt goes out exactly as-is

The platform delivers and stores it
Gmail, Slack and WhatsApp keep a copy

Your unfiltered voice is the record
It can't expire and you can't take it back.

BlackMail

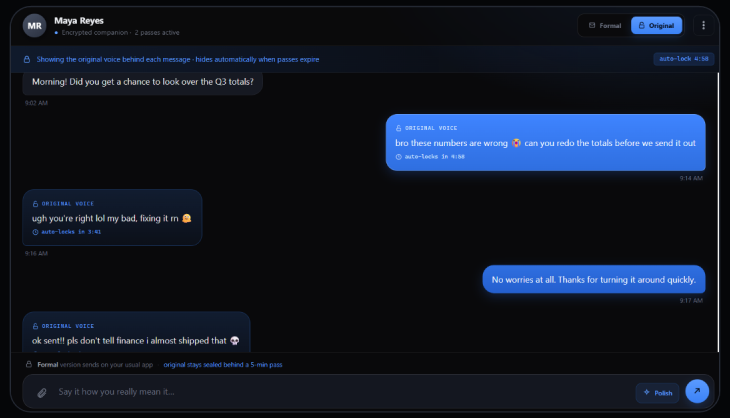

You still write in your real voice
One draft, split into two channels

Formal rewrite
Reviewed by you, then saved as the record.

Sealed original
AES-256-GCM, using RTC data channel.

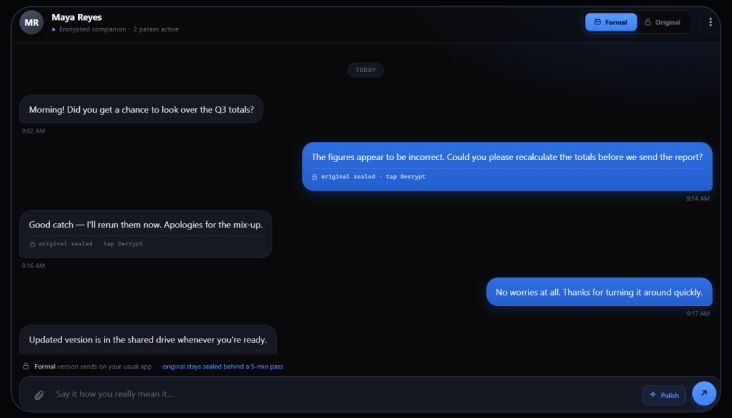

The deliberate version is the record
Your real voice is temporary: refresh clears it.

How BlackMail works

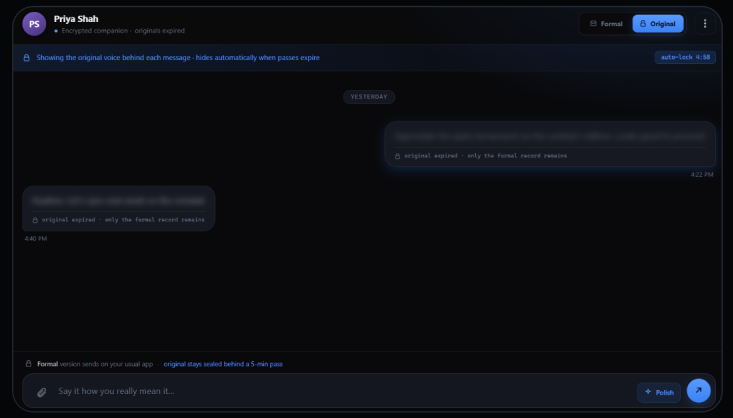

1. Write naturally

Type how you mean it. Original view keeps your real voice.

2. Send the formal text

You review the formal version, and it is saved as the record.

3. Let the original expire

Sent peer to peer, encrypted. Refresh clears it; the formal record stays.
